

## **The Ercros factory in Flix welcomes the visit of soil management and restoration students**

A group of 22 students and three professors of management and restoration of contaminated soils, and contaminated soils and sanitation techniques subjects, which are taught at the universities of Barcelona and Lleida, have visited the Ercros centre in Flix to learn about the remediation processes of the land of this centre. The students' training in chemistry, pharmacy, biology or geology has meant that the focus of the visit has been very technical.

Gonzalo Navarro, head of the Flix sustainability department, was in charge of welcoming and making the initial presentation of the day. In turn, Lara Caso, a technician from the Ercros sustainable development department, was in charge of presenting the soil remediation management that is being carried out at the Flix factory and accompanying the students to see on the ground the different actions carried out and the operation of the associated water treatment plant.

The teachers and students have valued the visit as very didactic and of great scientific quality.
