

High school students visit the Ercros factory in Almussafes

The Ercros factory in Almussafes has opened its doors to receive a group of second-year high school students from the institute in this Valencian town. The students, accompanied by a teacher, have been guided by technical personnel from the factory.

The visit began with a general presentation of Ercros and a more detailed explanation of how the factory works. Next, the students, dressed in the regulatory equipment, have visited the laboratory facilities where they have received a brief explanation of how it functions.

The Almussafes factory is the world leader in the paraformaldehyde market and exports 95% of its production. This product is mainly used in the manufacture of auxiliary products in the automobile industry and in the wood industry.
